3D Solutions For Linux

- SGI Sample Implementation (SI)
- NVIDIA
- Xi Graphics
- Metrolink
- Workstation Vendors

SGI Sample Implementation (SI)

- Sample implementation used by SGI's OpenGL licensees
- Mature (in development since 1992)
- Open source in January 2000, includes
  - OpenGL 1.2
  - GLX 1.3
  - GLU 1.3
  - utilities & man pages

SGI Sample Implementation (SI)

- Open source SI, means SI-based IHV drivers can be open sourced
- Currently builds against XFree86 3.3.6
  - with indirect rendering
- GLX implementation part of XFree86 4.0
- GLU implementation used in Mesa
- Read-only cvs tree access + tarball
- oss.sgi.com/projects/ogl-sample

NVIDIA

- **Proprietary XFree86 4.0 drivers for OpenGL 1.2**
  - collaboration with SGI and VA Linux
- **Supports TNT*, GeForce, Quadro**
  - direct rendering, AGP 4X, NVIDIA extensions
- **Common code base with MS Windows drivers**
  - well tested

NVIDIA

- **Available from NVIDIA's web site**
  - Driver binaries for RedHat 6.1, 6.2 (build .94)
    - XFree86 4.0 X driver + GLX module
    - loadable kernel module
    - client-side GLX, OpenGL, GLU
  - kernel module comes with some source code
    - recompile against different kernel versions
- **XFree86 4.0 binaries from RedHat**
  - ftp://rawhide.redhat.com/rawhide/i386/RedHat/RPMS

NVIDIA

- **Installation and troubleshooting FAQ available on NVIDIA's website**
- **Known bugs**
  - glXUseXFont + XFree86 4.0 xlib = core dump
  - Some SMP driver lock-ups
  - dlopen() interactions, single head only, ...
- **Configuration options**
  - lock to vertical sync, full screen AA

NVIDIA

- **Open source driver for NV1, RIVA, TNT, GeForce**
- **XFree86 3.3.6**
- **Lower performance than proprietary driver**
- **www.nvidia.com/Products/Drivers.nsf**

Xi Graphics 3D Accelerated-X

- **Proprietary X server and OpenGL 1.2 drivers**
- **Support for many architectures**
  - ATI, Matrox, 3Dlabs, Number9, 3dfx, S3
  - Laptops, multiple heads
- **Entertainment & professional versions of the product**
- **www.xig.com**

Metrolink

- **Proprietary X server and OpenGL 1.2 drivers**
- **Broad support**
  - ATI, NVIDIA, S3, 3Dlabs, Matrox, E&S
- **Indirect rendering, little hardware acceleration**
- **www.metrolink.com**

Workstation Vendors

- **SGI 230/330/550 VPro series**
  - X86 \w RedHat 6.1 + SGI driver/kernel overlay
  - V3 and VR3 graphics
    - enhanced versions of NVIDIA GeForce & Quadro
  - Enhanced version of NVIDIA/SGI driver
  - 230, 330 shipping now
  - www.sgi.com/workstations/230/

Workstation Vendors

- **HP Visualize series**
  - currently X86-based, NVIDIA TNT2 graphics
  - RedHat 6.2
  - Beta version of X86-based, visualize-fx^5, fx^{10}
  - Proprietary X server and open source kernel module to support direct rendering
  - www.hp.com/visualize/products/linux/

Completeness & Conformance Issues for OpenGL & Mesa

- **Conformance and Testing**
- **ABIs and Versioning**
- **Linux OpenGL Base Standard (oglbase)**
- **Extensions**

Conformance and Testing

- **OpenGL ARB conformance test**
  - 'must pass' test plus other tests
  - must pass to call implementation OpenGL
    - not comprehensive, nor very strict (sanity test)
  - distributed to OpenGL licensees by SGI
  - SGI SI and Mesa pass most tests
    - doesn't necessarily mean SI-based IHV drivers pass

Conformance and Testing

- **Vendor specific tests**
  - Microsoft WHQL tests - includes conformance
  - ogtst - SGI proprietary, but some licensees have it as well
  - other vendor proprietary tests (3dfx, NVIDIA, …)

Conformance and Testing

- **Open source - glean**
  - test quality and performance
  - C++ code
  - can do side by side comparisons
  - if you find a driver bug, send test case to glean team and it will be added to glean
  - glean.sourceforge.org

ABIs and Versioning

- **OpenGL specification doesn't cover everything**
  - covers names of symbols, tokens, behavior of function calls, versioning
  - doesn't cover locations of header files, libraries, file names
    - /usr/lib/libGL.so -or- /usr/X11R6/lib/libGL.so, etc.
- **To release platform-independent apps, need everything standardized**

Linux/OpenGL Base Standard (oglbase)

- **OpenGL Application Binary Interface for Linux**
- **Like Linux Base Standard, but covers OpenGL runtime and sdk**
- **Representation from OpenGL providers and app vendors**
- **First version (1.0) last spring**

Linux/OpenGL Base Standard

- **For application deployment, specifies library packaging**
  - data type mappings for IA32 (e.g., Glint == int)
  - /usr/lib/libGL.so, libGL.so.1 - GLX + GL entry points
  - /usr/lib/libGLU.so, libGLU.so.1 - GLU entry points
  - the '.1' is for version 1.0 of the ABI, not OpenGL 1.0
  - entry points for OpenGL 1.2, GLX 1.3, GLU 1.3
  - thread-safe (pthreads)

Linux/OpenGL Base Standard

- **For SDK users, also includes locations and contents of header files**
  - /usr/include/GL/glx.h - GLX 1.3
  - /usr/include/GL/gl.h - OpenGL 1.2
  - **`GL_OGLBASE_VERSION`**
  - /usr/include/GL/glu.h - GLU 1.3
  - /usr/include/GL/glext.h - OpenGL extensions
  - /usr/include/GL/glxext.h - GLX extensions

Linux/OpenGL Base Standard

- **Recently released, not widely deployed**
  - oss.sgi.com/projects/ogl-sample/ABI/
- **Incorporated into XFree86 4.01**
- **Unlikely to be compatible with existing OpenGL distributions**

OpenGL Versioning

- **Multiple versions of OpenGL specification (1.0, 1.1, 1.2)**
- **All are backward compatible**
- **Both compile-time and run-time version queries**
  - **`GL_VERSION_1_2`**
  - **`glGetString(GL_VERSION)`**
    - e.g., 1.2.0 vendor_specific_info

OpenGL Versioning

- **oglbase ABI includes symbols for OpenGL 1.2**
  - Vendor may only ship 1.1 or 1.0 functionality
  - so apps should perform a run-time check
    - adapt to lesser functionality - or -
    - abort
- **Other Unix vendors may adopt similar rules**

OpenGL Versioning

- **Example**

```
char* vers = glGetString(GL_VERSION);
int v12 = strncmp(vers, "1.2", 3) == 0;

#ifdef GL_VERSION_1_2
if(v12){
    glTexImage3D(…);
} else
#endif
{
    /* non 1.2 dependent code */
}
```

Extensions

- **Method for adding new functionality to OpenGL**
  - ARB_multitexture, texenv_combine, ...
- **Important extensions become 'ARB' extensions**
- **Important extensions become part of base-line functionality**
- **Extensions are optional**

Extensions

- **Interesting Extensions**
  - GL_ARB_multitexture
  - GL_ARB_texture_env_add
  - GL_ARB_multisample
  - GL_ARB_tetxure_compression
  - GLX_ARB_get_proc_address
  - GL_EXT_blend_color
  - GL_EXT_blend_subtract

Extensions

- **Only ARB extensions are included in the OpenGL specification**
- **ARB does provide rules for defining an extension**
  - manages registry of extension specs
  - oss.sgi.com/projects/ogl-sample/registry/
  - assigns token values, function names (avoids collisions)

Extensions

- **Portable applications (binary) may work with or without a particular extension**
  - reduce number of versions of application
- **Problem occurs when**
  - application is linked against extension entry point
  - target platform OpenGL doesn't include extension
  - unresolved symbols at run-time

Extensions

- **Example**

```
char* ext = glGetString(GL_EXTENSIONS);
multitex = strstr(ext, "ARB_multitexture" )!= NULL

#ifdef GL_ARB_multitexture
if (multitex){
    glActiveTextureARB(GL_TEXTURE1_ARB);
    ...
} else
#endif
{
    /* multi-pass texture code */
}
```

Extensions

- **Solution, use soft references to symbols**
- **GLX_ARB_get_proc_address provides run-time queries**
  - similar to dlsym()
- **Application does run-time query for extension**
- **If present, does symbol lookup and uses it**
- **If not, use alternate code path**

Extensions

- **GLX_ARB_get_proc_address**

```
char* ext = glGetString(GL_EXTENSIONS);
multitex = strstr(ext, "ARB_multitexture" )!= NULL

#ifdef GL_ARB_multitexture
if (multitex){
   PFNGLACTIVETEXTUREARBPROC glActiveTextureARBp =
      glXGetProcAddressARB("glActiveTextureARB");
   (*glActiveTextureARBp)(GL_TEXTURE1_ARB);
} else
#endif
{
    /* multi-pass texture code */
}
```

Extensions

- **GLX_get_proc_address part of oglbase ABI**
- **Similar functionality in MS Windows**
  - WGL_get_proc_address
  - WGL version context dependent, oglbase not
- **Likely to be supported by other Unix vendors**

Extensions for SDK Users

- **Problem with header files**
- **SGI maintains glext.h and glxext.h as central definitions**
- **Idiotic MS `PFN<unreadable_function_name>` typedefs included**
  - for use with WGL/GLX_get_proc_addr
- **Include automatically in gl.h and glx.h**
  - unless **`GL_GLEXT_LEGACY`**, **`GL_GLXEXT_LEGACY`** defined

Extensions for SDK Users

- **`GL_GLEXT_PROTOTYPES` to control whether function prototypes defined**
- **Developers can download latest and greatest**
  - http://oss.sgi.com/projects/ogl-sample/ABI/glext.h
- **Vendors may still have extra header files**
  - Proprietary extensions

Futures

- **Direct Rendering Infrastructure**
- **OpenGL Directions**
- **oglbase Directions**
- **Conformance**

Direct Rendering Infrastructure

- **Support more chips**
- **Port to other processors, OSes**
- **Track OpenGL evolution**
- **Performance tune**
- **Accommodate more vendor-specific implementations**
  - Avoid having vendors replace libGL.so with their own version

OpenGL Direction

- **Standardization of more ARB extensions**
- **Upgrades to the SI**
  - add ARB extensions
  - XFree86 4.0
  - rpm packages for GLU, man pages, etc
  - optimized geometry code
- **New code**
  - GLS, GLC, etc

oglbase

- **Resolve outstanding issues**
  - Definitions for other hardware (PowerPC, Alpha, …)
- **Integrate into Linux Base standard**
- **Track ARB extensions and consider other extension symbols for inclusion in the ABI**

glean

- **Add more tests**
- **Build repository of test results for different platforms**

GLsetup

- **Version of Glsetup for Linux?**
- **www.glsetup.com**
